#### d3po

d3po is a project designed to allow an astronomer (or anyone), with no special data visualization stills, to make an interactive, publication-quality figure that has staged builds and linked brushing through scatter plots. Our current version can be previewed at d3po.org, and represents a figure from upcoming work by graduate student Elisabeth Newton. The figure describes how metalicity affects color in cool stars, and represents a nice use case for d3po. Try clicking and dragging in the scatter plots to understand the power of linked brushing in published figures.

Right now we are in search of alpha testers, who have figures that could be made interactive and who are willing to get their hands a little dirty (Ng iavascript skills needed). In future versions, we plan to link to glue to allow the creation of d3po figures interactively. We are also exploring implementation of d3po within presentations and within authorea. Full 1.0 version expected in January 2014.

#### Installing your own d3po server

git clone git@github.com:adrn/d3po.git cd d3po virtualenv --no-site-packages venv source venv/bin/activate pip install -- pip-requirements.txt python run.py

After Galileo discovered the first four moons of Jupiter, it took nearly three hundred years to discover the next one.

dendrogram of the CLUMPFIND segmentation (b), with the same four labels used in Fig. 1 and in a. As 'clumps' are not allowed to belong to larger

structures, each pseudo-branch in **d** is simply a series of lines connecting the

maximum emission value in each clump to the threshold value. A very large number of clumps appears in b because of the sensitivity of CLUMPFIND to

noise and small-scale structure in the data. In the online PDF version, the 3D cubes (a and b) can be rotated to any orientation, and surfaces can be turned on and off (interaction requires Adobe Acrobat version 7.0.8 or higher). In the printed version, the front face of each 3D cube (the 'home' view in the interactive online version) corresponds exactly to the patch of sky shown in Fig. 1, and velocity with respect to the Local Standard of Rest increases from

data, CLUMPFIND typically finds features on a limited range of scales,

above but close to the physical resolution of the data, and its results can

be overly dependent on input parameters. By tuning CLUMPFIND's

two free parameters, the same molecular-line data set8 can be used to

show either that the frequency distribution of clump mass is the same

as the initial mass function of stars or that it follows the much shal-

lower mass function associated with large-scale molecular clouds

schematically. The dendrogram que ima of emission merge with each explained in Supplementary Meth determined almost entirely by th sensitivity to algorithm parameter possible on paper and 2D screen data (see Fig. 3 and its legend cross, which eliminates dimenpreserving all information Numbered 'billiard ball' lab features between a 2D map online) and a sorted dendre A dendrogram of a spectr of key physical properties

surfaces, such as radius (K). (L). The volumes can have any shape the significance of the especially elongated features (Fig. 2a). The luminosity is an approximate proxy for mass, a that  $M_{\text{lum}} = X_{13\text{CO}}L_{13\text{CO}}$ , where  $X_{13\text{CO}} = 8.0 \times 10^{20} \text{ cm}^2 \text{ K}^{-1} \text{ km}^{-1} \text{ s}$ (ref. 15; see Supplementary Methods and Supplementary Fig. 2). The derived values for size, mass and velocity dispersion can then be used to estimate the role of self-gravity at each point in the hierarchy, via calculation of an 'observed' virial parameter,  $\alpha_{obs} = 5\sigma_{\nu}^{2} R/GM_{lum}$ . In principle, extended portions of the tree (Fig. 2, yellow highlighting) where  $\alpha_{obs} < 2$  (where gravitational energy is comparable to or larger than kinetic energy) correspond to regions of p-p-v space where selfgravity is significant. As  $\alpha_{obs}$  only represents the ratio of kinetic energy to gravitational energy at one point in time, and does not explicitly capture external over-pressure and/or magnetic fields16, its measured value should only be used as a guide to the longevity (boundedness) of any particular feature.

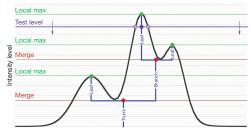

Figure 3 | Schematic illustration of the dendrogram process. Shown is the construction of a dendrogram from a hypothetical one-dimensional emission profile (black). The dendrogram (blue) can be constructed by 'dropping' a test constant emission level (purple) from above in tiny steps (exaggerated in size here, light lines) until all the local maxima and mergers are found, and connected as shown. The intersection of a test level with the emission is a set of points (for example the light purple dots) in one dimension, a planar curve in two dimensions, and an isosurface in three dimensions. The dendrogram of 3D data shown in Fig. 2c is the direct analogue of the tree shown here, only constructed from 'isosurface' rather than 'point' intersections. It has been sorted and flattened for representation on a flat page, as fully representing dendrograms for 3D data cubes would require four dimensions.

## A role for self-gravity at multiple length scales in the process of star formation

Alyssa A. Goodman<sup>1,2</sup>, Erik W. Rosolowsky<sup>2,3</sup>, Michelle A. Borkin<sup>1</sup><sup>†</sup>, Jonathan B. Foster<sup>2</sup>, Michael Halle<sup>1,4</sup>, Jens Kauffmann<sup>1,2</sup> & Jaime E. Pineda<sup>2</sup>

Self-gravity plays a decisive role in the final stages of star formation, where dense cores (size ~0.1 parsecs) inside molecular clouds collapse to form star-plus-disk systems<sup>1</sup>. But self-gravity's role at earlier times (and on larger length scales, such as ~1 parsec) is unclear; some molecular cloud simulations that do not include self-gravity suggest that 'turbulent fragmentation' alone is sufficient to create a mass distribution of dense cores that resembles, and sets, the stellar initial mass function<sup>2</sup>. Here we report a 'dendrogram' (hierarchical tree-diagram) analysis that reveals that self-gravity plays a significant role over the full range of possible scales traced by <sup>13</sup>CO observations in the L1448 molecular cloud, but not everywhere in the observed region. In particular, more than 90 per cent of the compact 'pre-stellar cores' traced by peaks of dust emission<sup>3</sup> are projected on the sky within one of the dendrogram's self-gravitating 'leaves'. As these peaks mark the locations of already-forming stars, or of those probably about to form, a self-gravitating cocoon seems a critical condition for their exist.

overlapping features as an option, significant emission found between prominent clumps is typically either appended to the nearest clump or turned into a small, usually 'pathological', feature needed to encompass all the emission being modelled. When applied to molecular-line

#### ABSTRACT

We present an overview of data available for the Ophiuchus and Perseus molecular clouds from Phase I of the COMPLETE Survey of Star-Forming Regions. This survey provides a range of data complementary to the *Spitzer* Legacy Program "From Molecular Cores to Planet Forming Disks." Phase I includes the following: extinction maps derived from the Two Micron All Sky Survey (2MASS) near-infrared data using the NICER algorithm; extinction and temperature maps derived from *IRAS* 60 and 100  $\mu$ m emission. H 1 maps of atomic gas; <sup>12</sup>CO and <sup>13</sup>CO maps of molecular gas; and submillimeter continuum images of emission from dust in densi cores. Not unexpectedly, the morphology of the regions appears quite different depending on the column density tracer that is used, with *IRAS* for and 100 being biased by chemical, excitation, and optical depth effects. Histograms of column density distribution are presented, showing that extinction as derived from 2MASS NICER gives the closes match to a lognormal distribution, as is predicted by numerical simulations. All the data presented in this paper, and links to more detailed publications on their implications, are publicly available at the COMPLETE Web site.

Key words: ISM: clouds - stars: formation - surveys

#### Who, How, and Who's Paying?

The ADS All Sky Survey was first funded via a 2012 grant from the NASA ADAP program to Seamless Astronomy, in collaboration with CDS, Astrometry.net and Microsoft Research.

#### Articles-on-the-Sky

was first deployed in 2014, using APIs from WWT (Microsoft Research, now AAS) and CDS (Aladin)

#### Images-on-the-Sky

relies on the astrometry.net, Zooniverse, IOP/AAS Astronomy Image Explorer and WorldWide Telescope platforms, and it is funded by the **American Astronomical Society**, in addition to the NASA ADAP grant.

These projects rely on open source sofware, primarily hosted on **GitHub**.

#### WORDS FROM THE RESEARCHE

"Your contributions unlock the information from old astronomy journals. Thank you and enjoy the images!"

#### ABOUT ASTRONOMY REWIND

Inis project is part of an ongoing NASA-fundee effort aimed at furning the SAU/NASA startophysics Data System (ADS) into a data resource. The result will be a database of starto-referenced images, i.e., images of the sky for which coordinates, orientation, and pixel scale will be publicly available through NASA data archives, the Astronomy Image Explorer, and World Wide Telescope, thanks to your hep!

TEN QUESTIONS TO ASK WHEN CREATING A VISUALIZATION

### The 10 Questions

- 1. Who | Who is your audience? How expert will they be about the subject and/or display conventions?
- 2. Explore-Explain | Is your goal to explore, document, or explain your data or ideas, or a combination of these?
- 3. Feature & Pattern Recognition | Is feature and/or pattern recognition, a goal?
- 4. **Predictions & Uncertainty** | Are you making a comparison between data and/or predictions? Is representing uncertainty a concern?
- 5. **Dimensions** | What is the intrinsic number of dimensions (not necessarily spatial) in your data, and how many do you want to show at once?
- 6. Categories & Clustering | Are there natural, or imposed, categories within the data? Are you interested in clustering?
- 7. Abstraction & Accuracy | Do you need to show all the data, or is summary or abstraction OK?
- 8. Context & Scale | Can you, and do you want to, put the data into a standard frame of reference, coordinate system, or show scale(s)?
- 9. Metadata | Do you need to display or link to non-quantitative metadata? (including captions, labels, etc.)
- 10. Display Modes | What display modes might be used in experiencing your display?
